Signals and Systems - Università degli Studi di Verona

A deterministic signal is a signal in which each value of the signal is fixed and can be determined by a mathematical expression, rule, or table. Because of this, the future values of the signal can be calculated from past values with complete confidence. On the other hand, a random signal has a lot of uncertainty about its behavior.

1.1 Continuous and Discrete Signals and Systems

1.1 Continuous and Discrete Signals and Systems A continuous signal is a mathematical function of an independent variable t , where t represents a set of real numbers. It is required that signals are uniquely defined in t except for a finite number of points. For example, the function $f(t) = \sqrt{t}$ does not qualify for a signal even for $t \geq 0$ since the square root
